Abstract

A new construction for the form sum of positive, selfadjoint operators is given in this paper. The situation is a bit more general, because our aim is to add positive, symmetric operators. With the help of the used method, some commutation properties of the form sum extension are observed.

1 Introduction

Given two positive, selfadjoint operators A and B in the Hilbert space \mathfrak{H} , we may form the operator sum $A + B$ on $\text{dom } A \cap \text{dom } B$. However, the intersection of the domains may be zero-dimensional, and in general nothing can assure us that the sum will be a selfadjoint operator. The so called form sum extension handles this problem if $\text{dom } A^{\frac{1}{2}} \cap \text{dom } B^{\frac{1}{2}}$ is dense in \mathfrak{H} . Define $q_A(x) = (A^{\frac{1}{2}}x, A^{\frac{1}{2}}x)$ and $q_B(x) = (B^{\frac{1}{2}}x, B^{\frac{1}{2}}x)$ two closed forms; their sum $q_A + q_B$ is a closed form on $\text{dom } A^{\frac{1}{2}} \cap \text{dom } B^{\frac{1}{2}}$, therefore the representation theorem provides us a selfadjoint operator C , such that C and $A + B$ coincide on $\text{dom } A \cap \text{dom } B$ [2]. The usual notation for the form sum of A and B is $A \dot{+} B$. In Section 2, we give a new construction of the form sum of positive, symmetric operators. Section 3 deals with commutation properties of this extension, i.e. how our extension method can preserve commutation with bounded operators. In the last section we give some examples concerning the form sum extension, and describe the relation between other extensions of operator sums.

We use the following notations, and refer the reader to [5], [6] and [7]. Throughout a, b will denote positive, symmetric operators in the Hilbert space \mathfrak{H} , with not necessarily dense domains. $D_*(a)$ will denote the so-called form domain of a , i.e.

$$D_*(a) = \{y \in \mathfrak{H} : \exists m_y \ |(ax, y)|^2 \leq m_y(ax, x), \forall x \in \text{dom } a\}.$$

We remark, if a is positive, selfadjoint, then $D_*(a) = \text{dom } a^{\frac{1}{2}}$. The KREIN-VON NEUMANN and FRIEDRICHS extensions of a will be denoted by a_K and a_F respectively (provided they exist). We recall the basic notions now. If $D_*(a)$ is dense in \mathfrak{H} , then $\langle ax, ay \rangle = (ax, y)$ is an inner product on $\text{ran } a$. Let \mathfrak{H}_a denote the completion of the pre-Hilbert space $\text{ran } a$ with the above inner product.

AMS Subject Classification (1991): 47A20-47B25

Define $J_a : \mathfrak{H}_a \rightarrow \mathfrak{H}$ and $Q_a : \mathfrak{H} \rightarrow \mathfrak{H}_a$ by

$$\begin{aligned} \text{dom } J_a &= \text{ran } a, & J_a ax &= ax \text{ for all } ax \in \text{ran } a \\ \text{dom } Q_a &= \text{dom } a, & Q_a x &= ax \text{ for all } x \in \text{dom } a \end{aligned}$$

Now, if $D_*(a)$ is dense, then $J_a^{**} J_a^*$ is the smallest positive selfadjoint extension of a , i.e. the KREIN-VON NEUMANN extension (see [6], [7]). Also, the following characterizing properties of a_K will be used frequently in this paper

$$\begin{aligned} \text{dom } a_K^{\frac{1}{2}} &= \text{dom } J_a^* = D_*(a) \\ \|a_K^{\frac{1}{2}} y\|^2 &= \|J_a^* y\|^2 = \sup_{\substack{x \in \text{dom } a \\ \langle ax, x \rangle \leq 1}} |(ax, y)|^2 \quad \text{for all } y \in \text{dom } a_K^{\frac{1}{2}} \end{aligned}$$

Provided that $\text{dom } a$ is dense, $Q_a^* Q_a^{**}$ furnishes the largest positive selfadjoint extension, that is the FRIEDRICHS extension of a (see [5]). Note that $\text{dom } a \subseteq D_*(a)$, therefore the denseness of $\text{dom } a$ implies the same for $D_*(a)$.

2 The form sum extension

In the following we give a new construction for the sum of two positive, symmetric operators. We show that in case of selfadjoint operators this construction supplies the form sum of the operators.

Let a and b be two positive, symmetric operators, and suppose that $D_*(a) \cap D_*(b)$ is dense in \mathfrak{H} . Consider the space $\mathfrak{H}_a \oplus \mathfrak{H}_b$, and the operator

$$J : \mathfrak{H}_a \oplus \mathfrak{H}_b \rightarrow \mathfrak{H}, \text{ with } \text{dom } J = \text{ran } a \oplus \text{ran } b, \quad J(ax \oplus by) = ax + by. \quad (1)$$

It is easy to prove that J^* is densely defined; indeed $D_*(a) \cap D_*(b) = \text{dom } J^*$. To see this, let $x \in \text{dom } a, y \in \text{dom } b$ and $u \in D_*(a) \cap D_*(b)$, then

$$\begin{aligned} |(J(ax \oplus by), u)|^2 &= |(ax, u) + (by, u)|^2 \leq 2|(ax, u)|^2 + 2|(by, u)|^2 \leq \\ &2m_u(ax, x) + 2n_u(by, y) \leq m \langle ax \oplus by, ax \oplus by \rangle, \end{aligned}$$

with $m = 2 \max(m_u, n_u)$. This shows that $u \in \text{dom } J^*$, hence $D_*(a) \cap D_*(b) \subseteq \text{dom } J^*$. For the reverse, let $u \in \text{dom } J^*$ and $x \in \text{dom } a$, then

$$|(ax, u)|^2 = |(J(ax \oplus \mathbf{0}), u)|^2 \leq m \langle ax \oplus \mathbf{0}, ax \oplus \mathbf{0} \rangle = m \langle ax, ax \rangle = m(ax, x),$$

with a suitable $m \geq 0$, therefore $u \in D_*(a)$. Similarly, we obtain that $u \in D_*(b)$. Thus we have shown that $D_*(a) \cap D_*(b) \supseteq \text{dom } J^*$.

We see that J^{**} exists. Now, we calculate J^* on $\text{dom } a \cap \text{dom } b$. Let $u \in \text{dom } a \cap \text{dom } b$ and $x \in \text{dom } a, y \in \text{dom } b$, then

$$(J(ax \oplus by), u) = (ax, u) + (by, u) = \langle ax, au \rangle + \langle by, bu \rangle = \langle ax \oplus by, au \oplus bu \rangle,$$

consequently $J^* u = au \oplus bu$.

According to the VON NEUMANN theorem $J^{**} J^*$ is positive and selfadjoint. We claim that $J^{**} J^*$ is an extension of $a + b$. Indeed, let $u \in \text{dom } a \cap \text{dom } b$, then

$$J^{**} J^* u = J^{**} (au \oplus bu) = J(au \oplus bu) = au + bu = (a + b)u.$$

In order to prove that our construction is a generalization of the form sum of selfadjoint operators, we need the following lemma on the KREIN-VON NEUMANN extension (see [7], [5] and [6]).

Lemma 1. *If a, b are positive, symmetric operators, and $D_*(a)$ and $D_*(b)$ are dense in \mathfrak{H} , then $D_*(a \oplus b)$ is dense in $\mathfrak{H} \oplus \mathfrak{H}$ and*

$$a_K \oplus b_K = (a \oplus b)_K.$$

Proof. First we show that $(a \oplus b)_K$ exists. It is enough to prove that $D_*(a \oplus b) = \text{dom}(a_K \oplus b_K)^{\frac{1}{2}}$ since the latter is dense in $\mathfrak{H} \oplus \mathfrak{H}$.

We observe first that $(a_K \oplus b_K)^{\frac{1}{2}} = (a_K^{\frac{1}{2}} \oplus b_K^{\frac{1}{2}})$, indeed both are positive and selfadjoint with the same square $a_K \oplus b_K$.

Now, using the definition, we can write:

$$\begin{aligned} D_*(a \oplus b) &= \\ \{x \oplus y : \exists m_{x,y} \mid ((a \oplus b)(u \oplus v), x \oplus y)^2 &\leq m_{x,y}((a \oplus b)(u \oplus v), u \oplus v), \forall u \oplus v \in \text{dom } a \oplus b\} \\ &= \{x \oplus y : \exists m_{x,y} \mid (au, x) + (bv, y)^2 \leq m_{x,y}((au, u) + (bv, v)) \forall u \oplus v \in \text{dom } a \oplus \text{dom } b\}. \end{aligned} \quad (2)$$

$$\begin{aligned} \text{dom}(a_K \oplus b_K)^{\frac{1}{2}} &= \text{dom}(a_K^{\frac{1}{2}} \oplus b_K^{\frac{1}{2}}) = \text{dom } a_K^{\frac{1}{2}} \oplus \text{dom } b_K^{\frac{1}{2}} = D_*(a) \oplus D_*(b) = \\ \{x : \exists m_x \mid |(au, x)|^2 &\leq m_x(au, u), \forall u \in \text{dom } a\} \oplus \{y : \exists m_y \mid |(bv, y)|^2 \leq m_y(bv, v), \forall v \in \text{dom } b\}. \end{aligned} \quad (3)$$

Putting $u = 0$ and respectively $v = 0$ in (2), we see that

$$D_*(a \oplus b) \subseteq \text{dom}(a_K \oplus b_K)^{\frac{1}{2}}.$$

To show

$$D_*(a \oplus b) \supseteq \text{dom}(a_K \oplus b_K)^{\frac{1}{2}},$$

we let $m_{x,y} = 2 \max(m_x, m_y)$, and use (2), (3) and the convexity of the function $\alpha \mapsto \alpha^2$ on \mathbb{R}_+ . We have seen consequently that $D_*(a \oplus b) = \text{dom}(a_K \oplus b_K)^{\frac{1}{2}}$. So the KREIN-VON NEUMANN extension of $a \oplus b$ exists, and we know that $D_*(a \oplus b) = \text{dom}(a \oplus b)_K^{\frac{1}{2}}$.

To see that $(a \oplus b)_K = a_K \oplus b_K$, we have to check that

$$\text{dom}(a \oplus b)_K^{\frac{1}{2}} = \text{dom}(a_K \oplus b_K)^{\frac{1}{2}}$$

and furthermore that

$$\|(a_K \oplus b_K)^{\frac{1}{2}} z\|^2 = \|(a \oplus b)_K^{\frac{1}{2}} z\|^2$$

holds for all $z \in \text{dom}(a \oplus b)_K^{\frac{1}{2}}$.

The equality of the domains follows from the above argument.

Now, we prove the required identity. Let $x \oplus y \in \text{dom}(a \oplus b)_K^{\frac{1}{2}}$.

$$\|(a_K \oplus b_K)^{\frac{1}{2}}(x \oplus y)\|^2 = \|(a_K^{\frac{1}{2}} \oplus b_K^{\frac{1}{2}})(x \oplus y)\|^2 = \|a_K^{\frac{1}{2}}x \oplus b_K^{\frac{1}{2}}y\|^2 = \|a_K^{\frac{1}{2}}x\|^2 + \|b_K^{\frac{1}{2}}y\|^2 \quad (4)$$

Now we calculate $\|(a \oplus b)_K^{\frac{1}{2}}(x \oplus y)\|^2$. The inequality

$$\|(a \oplus b)_K^{\frac{1}{2}}(x \oplus y)\|^2 \leq \|a_K^{\frac{1}{2}}x\|^2 + \|b_K^{\frac{1}{2}}y\|^2 \quad (5)$$

follows immediately from the minimality of the KREIN-VON NEUMANN extension and the fact that $a_K \oplus b_K$ is a positive, selfadjoint extension of $a \oplus b$.

To see the reverse inequality, we consider the following. We can assume that $\|a_K^{\frac{1}{2}}x\|^2 + \|b_K^{\frac{1}{2}}y\|^2 > 0$, therefore we let

$$t = \frac{\|a_K^{\frac{1}{2}}x\|^2}{\|a_K^{\frac{1}{2}}x\|^2 + \|b_K^{\frac{1}{2}}y\|^2}, \quad \text{thus} \quad 1 - t = \frac{\|b_K^{\frac{1}{2}}y\|^2}{\|a_K^{\frac{1}{2}}x\|^2 + \|b_K^{\frac{1}{2}}y\|^2}.$$

$$\sup_{\substack{u \in \text{dom } a, v \in \text{dom } b \\ (a_K u, u) + (b_K v, v) \leq 1}} |((a_K^{\frac{1}{2}} \oplus b_K^{\frac{1}{2}})(u \oplus v), (a_K^{\frac{1}{2}} \oplus b_K^{\frac{1}{2}})(x \oplus y))|^2 \geq \sup_{\substack{u \in \text{dom } a, v \in \text{dom } b \\ (a_K u, u) \leq t, (b_K v, v) \leq 1-t}} |(a_K^{\frac{1}{2}} u, a_K^{\frac{1}{2}} x) + (b_K^{\frac{1}{2}} v, b_K^{\frac{1}{2}} y)|^2$$

Now multiplying u and v by a suitable $\alpha_u, \alpha_v \in \mathbb{C}$ of absolute value 1, we continue:

$$\begin{aligned} \sup_{\substack{u \in \text{dom } a, v \in \text{dom } b \\ (a_K u, u) \leq t, (b_K v, v) \leq 1-t}} |(a_K^{\frac{1}{2}} u, a_K^{\frac{1}{2}} x) + (b_K^{\frac{1}{2}} v, b_K^{\frac{1}{2}} y)|^2 &= \sup_{\substack{u \in \text{dom } a, v \in \text{dom } b \\ (a_K u, u) \leq t, (b_K v, v) \leq 1-t}} (|(a_K^{\frac{1}{2}} u, a_K^{\frac{1}{2}} x)| + |(b_K^{\frac{1}{2}} v, b_K^{\frac{1}{2}} y)|)^2 = \\ &= \left(\sup_{\substack{u \in \text{dom } a, \\ (a_K u, u) \leq t}} |(a_K^{\frac{1}{2}} u, a_K^{\frac{1}{2}} x)| + \sup_{\substack{v \in \text{dom } b, \\ (b_K v, v) \leq 1-t}} |(b_K^{\frac{1}{2}} v, b_K^{\frac{1}{2}} y)| \right)^2 = \\ &= t \|a_K^{\frac{1}{2}} x\|^2 + 2\sqrt{t(1-t)} \|a_K^{\frac{1}{2}} x\| \|b_K^{\frac{1}{2}} y\| + (1-t) \|b_K^{\frac{1}{2}} y\|^2 = \|a_K^{\frac{1}{2}} x\|^2 + \|b_K^{\frac{1}{2}} y\|^2 \end{aligned} \quad (6)$$

We have used that

$$\sup_{\substack{u \in \text{dom } a, \\ (a_K u, u) \leq t}} |(a_K^{\frac{1}{2}} u, a_K^{\frac{1}{2}} x)|^2 = \sup_{\substack{u \in \text{dom } a, \\ (a_K u, u) \leq t}} |(a_K u, x)|^2 = t \|a_K^{\frac{1}{2}} x\|^2 = \sup_{\substack{u \in \text{dom } a_K^{\frac{1}{2}}, \\ (a_K^{\frac{1}{2}} u, a_K^{\frac{1}{2}} u) \leq t}} |(a_K^{\frac{1}{2}} u, a_K^{\frac{1}{2}} x)|^2,$$

and the same for b_K . Putting together (4), (5) and (6) we obtain:

$$\|(a_K \oplus b_K)^{\frac{1}{2}}(x \oplus y)\|^2 = \|(a \oplus b)_K^{\frac{1}{2}}(x \oplus y)\|^2$$

completing the proof. \blacksquare

Theorem 2. Let a and b be positive, symmetric operators such that $D_*(a) \cap D_*(b)$ is dense in \mathfrak{H} , and let J be as in (1), then the form sum of a_K and b_K is $J^{**}J^*$, i.e.

$$a_K \dot{+} b_K = J^{**}J^*.$$

Proof. Again we prove that $\text{dom } (a_K \dot{+} b_K)^{\frac{1}{2}} = \text{dom } (J^{**}J^*)^{\frac{1}{2}}$, and $(a_K \dot{+} b_K)^{\frac{1}{2}}x = (J^{**}J^*)^{\frac{1}{2}}x$ for each $x \in \text{dom } (a_K \dot{+} b_K)$.

We know that $\text{dom } (a_K \dot{+} b_K)^{\frac{1}{2}} = \text{dom } a_K^{\frac{1}{2}} \cap \text{dom } b_K^{\frac{1}{2}}$, and $\text{dom } (J^{**}J^*)^{\frac{1}{2}} = \text{dom } J^* = D_*(a) \cap D_*(b)$, as we have seen in the argument following (1). Moreover $\text{dom } a_K^{\frac{1}{2}} = D_*(a)$ and $\text{dom } b_K^{\frac{1}{2}} = D_*(b)$, which implies the desired equality of the domains.

Using Lemma 1, we have that

$$\begin{aligned} \|(J^{**}J^*)^{\frac{1}{2}}x\|^2 &= \langle J^*x, J^*x \rangle = \sup_{\substack{u \in \text{dom } a, v \in \text{dom } b \\ \langle au \oplus bv, au \oplus bv \rangle \leq 1}} |\langle au \oplus bv, J^*x \rangle|^2 = \sup_{\substack{u \in \text{dom } a, v \in \text{dom } b \\ (au, u) + (bv, v) \leq 1}} |(au + bv, x)|^2 = \\ &= \sup_{\substack{u \oplus v \in \text{dom } a \oplus \text{dom } b \\ ((a \oplus b)(u \oplus v), u \oplus v) \leq 1}} |(a \oplus b)(u \oplus v), x \oplus x|^2 = \\ &= \|(a \oplus b)_K^{\frac{1}{2}}(x \oplus x)\|^2 = \|(a_K^{\frac{1}{2}} \oplus b_K^{\frac{1}{2}})(x \oplus x)\|^2 = \|a_K^{\frac{1}{2}}x\|^2 + \|b_K^{\frac{1}{2}}x\|^2. \end{aligned}$$

Therefore

$$\|(J^{**}J^*)^{\frac{1}{2}}x\|^2 = \|a_K^{\frac{1}{2}}x\|^2 + \|b_K^{\frac{1}{2}}x\|^2,$$

which is, by definition, equal to $\|(a_K \dot{+} b_K)^{\frac{1}{2}}x\|^2$. The theorem is proved. \blacksquare

The following theorem is an immediate consequence of Theorem 2, because for any positive, selfadjoint operator a , the KREIN-VON NEUMANN extension a_K and a coincide.

Theorem 3. *If a and b are positive, selfadjoint operators with $\text{dom } a^{\frac{1}{2}} \cap \text{dom } b^{\frac{1}{2}}$ dense in \mathfrak{H} , then the corresponding operator $J^{**}J^*$ is just the form sum of a and b .*

The previous theorem shows that the following notation is consistent with the notation for the form sum extension. From now on we will use $a \dot{+} b$ for the above constructed operator $J^{**}J^*$, even if a, b are positive, symmetric operators. We reformulate Theorem 2 as follows.

Theorem 4. *If a and b are positive, symmetric operators with $D_*(a) \cap D_*(b)$ dense in \mathfrak{H} , then $a \dot{+} b = a_K \dot{+} b_K$.*

Remark 5. Considering the extensions of direct sum of operators, an analogous statement can be proved for the FRIEDRICHS extension, as for the KREIN-VON NEUMANN extension in Lemma 1. Namely, if a, b are densely defined, positive, symmetric operators, then

$$a_F \oplus b_F = (a \oplus b)_F.$$

For the proof we only have to check the equality of the domains of the square root operators.

$$\begin{aligned} \text{dom } (a \oplus b)_F^{\frac{1}{2}} &= \{x \oplus y \in \mathfrak{H} \oplus \mathfrak{H} : \exists x_n \oplus y_n \in \text{dom } a \oplus b, x_n \oplus y_n \rightarrow x \oplus y, \\ &\quad ((a \oplus b)(x_n \oplus y_n - x_m \oplus y_m), x_n \oplus y_n - x_m \oplus y_m) \rightarrow 0\} = \\ &= \{x \oplus y \in \mathfrak{H} \oplus \mathfrak{H} : \exists x_n \in \text{dom } a, y_n \in \text{dom } b, x_n \rightarrow x, y_n \rightarrow y, \\ &\quad (a(x_n - x_m), x_n - x_m) + (b(y_n - y_m), y_n - y_m) \rightarrow 0\} = \\ &= \{x \in \mathfrak{H} : \exists x_n \in \text{dom } a, x_n \rightarrow x, (a(x_n - x_m), x_n - x_m) \rightarrow 0\} \oplus \\ &\quad \oplus \{y \in \mathfrak{H} : \exists y_n \in \text{dom } b, y_n \rightarrow y, (b(y_n - y_m), y_n - y_m) \rightarrow 0\} = \text{dom } a_F^{\frac{1}{2}} \oplus \text{dom } b_F^{\frac{1}{2}} \end{aligned}$$

3 Commutation properties

In this section we observe that our method constructing the form sum of positive, symmetric operators can preserve some kind of commutation with bounded operators. The ideas used in this section are essentially taken from [7], where the commutation property is proved for the KREIN-VON NEUMANN extension. The situation is as follows: given $E, F \in \mathcal{B}(\mathfrak{H})$ and two positive, symmetric operators a and b , with $D_*(a)$ and $D_*(b)$ dense in \mathfrak{H} , such that both E and F leave $\text{dom } a$ and $\text{dom } b$ invariant. Suppose furthermore that the following equations hold for all $x \in \text{dom } a$ and $y \in \text{dom } b$:

$$E^*ax = aFx, \quad F^*ax = aEx, \quad E^*by = bFy, \quad F^*by = bEy.$$

Now, we define \hat{E} and \hat{F} on $\mathfrak{H}_a \oplus \mathfrak{H}_b$ as follows.

$$\text{dom } \hat{E} = \text{ran } a \oplus \text{ran } b, \quad \hat{E}(ax \oplus by) = aEx \oplus bEy,$$

and

$$\text{dom } \hat{F} = \text{ran } a \oplus \text{ran } b, \quad \hat{F}(ax \oplus by) = aFx \oplus bFy.$$

It is obvious that \hat{E} and \hat{F} leave $\text{ran } a \oplus \text{ran } b$ invariant. The following lemma shows that both \hat{E} and \hat{F} are well-defined and continuous on a dense subspace of $\mathfrak{H}_a \oplus \mathfrak{H}_b$.

Lemma 6. *With the notations above, \hat{E} and \hat{F} are well defined, and $\hat{E}, \hat{F} \in \mathcal{B}(\mathfrak{H}_a \oplus \mathfrak{H}_b)$.*

Proof. The proof of this lemma could be considerably shortened by referring to the result [Theorem 2 in [7]]. However, for the sake of completeness we include the detailed proof.

$$\begin{aligned} \langle \hat{F}(ax \oplus by), \hat{F}(ax \oplus by) \rangle &= \langle aFx \oplus bFy, aFx \oplus bFy \rangle = \langle aFx, aFx \rangle + \langle bFy, bFy \rangle = \\ &= \langle aFx, Fx \rangle + \langle bFy, Fy \rangle = \langle E^*ax, Fx \rangle + \langle E^*by, Fy \rangle = \langle ax, EFx \rangle + \langle by, EFy \rangle = \\ &= \langle ax, aEFx \rangle + \langle by, bEFy \rangle = \langle ax \oplus by, aEFx \oplus bEFy \rangle \leq \\ &= \langle ax \oplus by, ax \oplus by \rangle^{\frac{1}{2}} \langle aEFx \oplus bEFy, aEFx \oplus bEFy \rangle^{\frac{1}{2}} = \\ &= \langle ax \oplus by, ax \oplus by \rangle^{\frac{1}{2}} \langle \hat{E}\hat{F}(ax \oplus by), \hat{E}\hat{F}(ax \oplus by) \rangle^{\frac{1}{2}} \end{aligned} \tag{7}$$

Substituting $\hat{E}\hat{F}$ for \hat{F} , and repeating the argument in (7), we obtain

$$\langle \hat{E}\hat{F}(ax \oplus by), \hat{E}\hat{F}(ax \oplus by) \rangle \leq \langle ax \oplus by, ax \oplus by \rangle^{\frac{1}{2}} \langle (\hat{E}\hat{F})^2(ax \oplus by), (\hat{E}\hat{F})^2(ax \oplus by) \rangle^{\frac{1}{2}}$$

From this, by induction:

$$\begin{aligned} \langle \hat{F}(ax \oplus by), \hat{F}(ax \oplus by) \rangle &\leq \langle ax \oplus by, ax \oplus by \rangle^{\frac{1}{2} + \dots + \frac{1}{2^n}} \langle (\hat{E}\hat{F})^{\frac{2^n}{2}}(ax \oplus by), (\hat{E}\hat{F})^{\frac{2^n}{2}}(ax \oplus by) \rangle^{\frac{1}{2^n}} = \\ &\langle ax \oplus by, ax \oplus by \rangle^{1 - \frac{1}{2^n}} \langle a(EF)^{\frac{2^n}{2}}x \oplus b(EF)^{\frac{2^n}{2}}y, a(EF)^{\frac{2^n}{2}}x \oplus b(EF)^{\frac{2^n}{2}}y \rangle^{\frac{1}{2^n}} = \\ &\langle ax \oplus by, ax \oplus by \rangle^{1 - \frac{1}{2^n}} \langle (F^*E^*)^{\frac{2^n}{2}}ax \oplus (F^*E^*)^{\frac{2^n}{2}}by, a(EF)^{\frac{2^n}{2}}x \oplus b(EF)^{\frac{2^n}{2}}y \rangle^{\frac{1}{2^n}} = \\ &\langle ax \oplus by, ax \oplus by \rangle^{1 - \frac{1}{2^n}} \langle ax \oplus by, (EF)^{2^n}x \oplus (EF)^{2^n}y \rangle^{\frac{1}{2^n}} \leq \\ &\langle ax \oplus by, ax \oplus by \rangle^{1 - \frac{1}{2^n}} \|ax \oplus by\|^{\frac{1}{2^n}} \|(EF)^{2^n}x \oplus (EF)^{2^n}y\|^{\frac{1}{2^n}} = \\ &\langle ax \oplus by, ax \oplus by \rangle^{1 - \frac{1}{2^n}} \|ax \oplus by\|^{\frac{1}{2^n}} \|((EF)^{2^n} \oplus (EF)^{2^n})(x \oplus y)\|^{\frac{1}{2^n}} \leq \\ &\langle ax \oplus by, ax \oplus by \rangle^{1 - \frac{1}{2^n}} \|ax \oplus by\|^{\frac{1}{2^n}} \|(EF)^{2^n} \oplus (EF)^{2^n}\|^{\frac{1}{2^n}} \|x \oplus y\|^{\frac{1}{2^n}} = \\ &\langle ax \oplus by, ax \oplus by \rangle^{1 - \frac{1}{2^n}} \|ax \oplus by\|^{\frac{1}{2^n}} \|(EF \oplus EF)^{2^n}\|^{\frac{1}{2^n}} \|x \oplus y\|^{\frac{1}{2^n}} \end{aligned}$$

If we take the limit $n \rightarrow \infty$, we obtain:

$$\langle \hat{F}(ax \oplus by), \hat{F}(ax \oplus by) \rangle \leq r(EF \oplus EF) \langle ax \oplus by, ax \oplus by \rangle,$$

where $r(EF \oplus EF)$ stands for the spectral radius of $EF \oplus EF$. And this is enough to prove both statements for \hat{F} . The proposition for \hat{E} can be proved analogously. (To be very precise, we have shown that \hat{E} and \hat{F} are continuously defined on a dense subspace of $\mathfrak{H}_a \oplus \mathfrak{H}_b$, but they are automatically extended to the whole space.) ■

Now, we compute the adjoints of \hat{E} and \hat{F} in $\mathcal{B}(\mathfrak{H}_a \oplus \mathfrak{H}_b)$:

Lemma 7. $\hat{E}^* = \hat{F}$ and $\hat{F}^* = \hat{E}$.

Proof. It is enough to prove $\hat{F}^* = \hat{E}$, as $\hat{E}, \hat{F} \in \mathcal{B}(\mathfrak{H}_a \oplus \mathfrak{H}_b)$. We check that $\hat{F}^*x = \hat{E}x$ on the dense subspace $\text{ran } a \oplus \text{ran } b$. Let $ax \oplus by \in \text{ran } a \oplus \text{ran } b$, then for all $au \oplus bv \in \text{ran } a \oplus \text{ran } b$

$$\begin{aligned} \langle au \oplus bv, \hat{F}^*(ax \oplus by) \rangle &= \langle \hat{F}(au \oplus bv), ax \oplus by \rangle = \langle aFu \oplus bFv, ax \oplus by \rangle = \\ &\langle aFu, ax \rangle + \langle bFv, by \rangle = \langle aFu, x \rangle + \langle bFv, y \rangle = \langle E^*au, x \rangle + \langle E^*bv, y \rangle = \langle au, Ex \rangle + \langle bv, Ey \rangle = \\ &\langle au, aEx \rangle + \langle bv, bEy \rangle = \langle au \oplus bv, aEx \oplus bEy \rangle = \langle au \oplus bv, \hat{E}(ax \oplus by) \rangle, \end{aligned}$$

and that was to be proved. ■

Theorem 8. Let a, b be positive, symmetric operators with $D_*(a) \cap D_*(b)$ dense in \mathfrak{H} , and suppose that $E, F \in \mathcal{B}(\mathfrak{H})$, such that both E and F leave $\text{dom } a$ and $\text{dom } b$ invariant, and for all $x \in \text{dom } a$ and $y \in \text{dom } b$

$$E^*ax = aFx, \quad F^*ax = aEx, \quad E^*by = bFy, \quad F^*by = bEy.$$

Then

$$E^*(a \dot{+} b) \subseteq (a \dot{+} b)F \quad \text{and} \quad F^*(a \dot{+} b) \subseteq (a \dot{+} b)E.$$

Proof. First we show the following:

$$E^*J \subseteq J\hat{F}, \quad F^*J \subseteq J\hat{E}, \quad \hat{E}J^* \subseteq J^*E, \quad \hat{F}J^* \subseteq J^*F.$$

Indeed, let $ax \oplus by \in \text{ran } a \oplus \text{ran } b$, then

$$J\hat{F}(ax \oplus by) = J(aFx \oplus bFy) = aFx + bFy = E^*ax + E^*by = E^*(ax \oplus by) = E^*J(ax \oplus by).$$

Observing the domains, we have consequently $E^*J \subseteq J\hat{F}$. An analogous proof can be given for $F^*J \subseteq J\hat{E}$. For the remaining inclusions, we write:

$$\hat{E}J^* = \hat{F}^*J^* \subseteq (J\hat{F})^* \subseteq (E^*J)^* = J^*E,$$

as E is bounded, hence $\hat{E}J^* \subseteq J^*E$, and with the same reasoning $\hat{F}J^* \subseteq J^*F$.

Finally we turn to the proof of the theorem. Using the previously proved statement, we have

$$E^*J^{**} \subseteq (J^*E)^* \subseteq (\hat{E}J^*)^* = J^{**}\hat{E}^* = J^{**}\hat{F}.$$

Note that we have used that \hat{E} is continuous according to Lemma 6. We complete the proof by writing

$$E^*(a \dot{+} b) = E^*J^{**}J^* \subseteq J^{**}\hat{F}J^* \subseteq J^{**}J^*F = (a \dot{+} b)F,$$

that is $E^*(a \dot{+} b) \subseteq (a \dot{+} b)F$, and with the same argument $F^*(a \dot{+} b) \subseteq (a \dot{+} b)E$. \blacksquare

The following result, which is just a special case of Theorem 8 with $E = F = S = S^*$, shows the reason why we talk about “commutation properties” above.

Theorem 9. *Let S be a bounded, selfadjoint operator over the Hilbert space \mathfrak{H} , such that S leaves both $\text{dom } a$ and $\text{dom } b$ invariant, and furthermore*

$$Sax = aSx, \quad Sby = bSy$$

hold for all $x \in \text{dom } a$ and $y \in \text{dom } b$. Also, assume that $D_(a) \cap D_*(b)$ is dense in \mathfrak{H} . Then*

$$S(a \dot{+} b) \subseteq (a \dot{+} b)S.$$

In Theorem 8, we required that the bounded operators E, F leave some subspaces invariant. In some cases, we might not know that such “big” subspaces are invariant, perhaps because they are not invariant at all, but we may find smaller subspaces whose invariance can be checked. We try to handle this problem, with the following theorem.

Theorem 10. *Let a and b be positive, symmetric operators with $D_*(a) \cap D_*(b)$ dense in \mathfrak{H} , and suppose that $D \subseteq \text{dom } a \cap \text{dom } b$ is a linear manifold. Then $a|_D \dot{+} b|_D = a \dot{+} b$ if and only if for all $x \in \mathfrak{H}$*

$$\sup_{\substack{u \in \text{dom } a, \\ (au, u) \leq 1}} |(au, x)|^2 + \sup_{\substack{v \in \text{dom } b, \\ (bv, v) \leq 1}} |(bv, x)|^2 = \sup_{\substack{u \in D, \\ (au, u) \leq 1}} |(au, x)|^2 + \sup_{\substack{v \in D, \\ (bv, v) \leq 1}} |(bv, x)|^2 \quad (8)$$

Proof. Before all, observe that $D_*(a) \subseteq D_*(a|_D)$, $D_*(b) \subseteq D_*(b|_D)$, indeed:

$$\begin{aligned} D_*(a) &= \{y \in \mathfrak{H} : \exists m_y |(ax, y)|^2 \leq m_y(ax, x), \forall x \in \text{dom } a\} \subseteq \\ &\{y \in \mathfrak{H} : \exists m_y |(ax, y)|^2 \leq m_y(ax, x), \forall x \in D\} = D_*(a|_D), \end{aligned} \quad (9)$$

and the same for $D_*(b)$ and $D_*(b|_D)$.

Suppose now that condition (8) is satisfied. Then for the reverse inclusion $D_*(a) \cap D_*(b) \supseteq D_*(a|_D) \cap D_*(b|_D)$ we let $x \in D_*(a|_D) \cap D_*(b|_D)$, which is the same as saying that the right hand side of (8) is finite for this x . But then, from assumption (8) it follows that the left hand side of (8) is also finite, implying $x \in D_*(a) \cap D_*(b)$. By our construction for the form sum

$$\text{dom}((a \dot{+} b)^{\frac{1}{2}}) = D_*(a) \cap D_*(b), \quad \text{and} \quad \text{dom}(a|_D \dot{+} b|_D)^{\frac{1}{2}} = D_*(a|_D) \cap D_*(b|_D),$$

hence $\text{dom } (a \dot{+} b)^{\frac{1}{2}} = \text{dom } (a|_D \dot{+} b|_D)^{\frac{1}{2}}$. Let $x \in \text{dom } (a \dot{+} b)^{\frac{1}{2}}$, then by the proof of Theorem 2 and (1)

$$\begin{aligned} \|(a \dot{+} b)^{\frac{1}{2}}x\|^2 &= \|a_K^{\frac{1}{2}}x\|^2 + \|b_K^{\frac{1}{2}}x\|^2 = \sup_{\substack{u \in \text{dom } a, \\ (au, u) \leq 1}} |(au, x)|^2 + \sup_{\substack{v \in \text{dom } b, \\ (bv, v) \leq 1}} |(bv, x)|^2 = \\ &= \sup_{\substack{u \in D, \\ (au, u) \leq 1}} |(au, x)|^2 + \sup_{\substack{v \in D, \\ (bv, v) \leq 1}} |(bv, x)|^2 = \|(a|_D)_K^{\frac{1}{2}}x\|^2 + \|(b|_D)_K^{\frac{1}{2}}x\|^2 = \|(a|_D \dot{+} b|_D)^{\frac{1}{2}}x\|^2. \end{aligned} \quad (10)$$

Consequently we have $a|_D \dot{+} b|_D = a \dot{+} b$.

For the reverse direction, we suppose that $a|_D \dot{+} b|_D = a \dot{+} b$. Then for all $x \in \text{dom } (a \dot{+} b)^{\frac{1}{2}}$ $\|(a \dot{+} b)^{\frac{1}{2}}x\|^2 = \|(a|_D \dot{+} b|_D)^{\frac{1}{2}}x\|^2$, and the same argument as in (10) shows that (8) is satisfied. ■

4 Further results and remarks

Our construction for the form sum is based on the idea used when constructing the KREIN-VON NEUMANN extension a_K of a positive, symmetric operator a . Analogously we consider the following situation. We suppose that $\text{dom } a$ and $\text{dom } b$ are dense. Again we have the Hilbert space $\mathfrak{H}_a \oplus \mathfrak{H}_b$, and we define analogously as in [5], [6]

$$Q : \mathfrak{H} \rightarrow \mathfrak{H}_a \oplus \mathfrak{H}_b, \text{ with } \text{dom } Q = \text{dom } a \cap \text{dom } b, \quad Qx = ax \oplus bx.$$

Obviously Q is a restriction of J^* . The question is, what can be said about Q^*Q^{**} .

Theorem 11. *Suppose that a and b are positive, symmetric operators, and $\text{dom } a \cap \text{dom } b$ is dense in \mathfrak{H} . Then $Q^*Q^{**} = (a + b)_F$.*

Proof. First we show that under these circumstances Q^*Q^{**} exists and is a positive, selfadjoint operator. From the VON NEUMANN theorem, it is clear that if Q^*Q^{**} exists then it is selfadjoint, and obviously positive. Q^* exists, since $\text{dom } Q$ is dense. We compute $\text{dom } Q^*$, and as it will be dense, we conclude that Q^{**} exists. First we compute Q^* on $\text{ran } a \oplus \text{ran } b$. Let $ax \oplus by \in \text{ran } a \oplus \text{ran } b$ and $z \in \text{dom } a \cap \text{dom } b$

$$\begin{aligned} \langle Qz, ax \oplus by \rangle &= \langle az \oplus bz, ax \oplus by \rangle = \langle az, ax \rangle + \langle bz, by \rangle = (az, x) + (bz, y) = \\ &= (z, ax) + (z, by) = (z, ax + by), \end{aligned}$$

which shows that $\text{ran } a \oplus \text{ran } b \subseteq \text{dom } Q^*$ and $Q^*(ax \oplus by) = ax + by$. Therefore Q^* is densely defined. We see that Q^*Q^{**} is an extension of $a + b$:

$$Q^*Q^{**}z = Q^*Qz = Q^*(az \oplus bz) = az + bz.$$

Because of the extremality of the FRIEDRICHS extension, we only have to prove that

$$\text{dom } (a + b)_F^{\frac{1}{2}} = \text{dom } (Q^*Q^{**})^{\frac{1}{2}}.$$

We can write

$$\begin{aligned} \text{dom } (Q^*Q^{**})^{\frac{1}{2}} &= \text{dom } Q^{**} = \text{dom } \bar{Q} = \{y \in \mathfrak{H} : \exists y_n \in \text{dom } Q, y_n \rightarrow y, Qy_n \text{ convergent}\} = \\ &= \{y \in \mathfrak{H} : \exists y_n \in \text{dom } Q, y_n \rightarrow y, \langle ay_n \oplus by_n - ay_m \oplus by_m, ay_n \oplus by_n - ay_m \oplus by_m \rangle \rightarrow 0\} = \\ &= \{y \in \mathfrak{H} : \exists y_n \in \text{dom } a \cap \text{dom } b, y_n \rightarrow y, (a(y_n - y_m), y_n - y_m) + (b(y_n - y_m), y_n - y_m) \rightarrow 0\} = \\ &= \{y \in \mathfrak{H} : \exists y_n \in \text{dom } (a + b), y_n \rightarrow y, ((a + b)(y_n - y_m), y_n - y_m) \rightarrow 0\} = \text{dom } (a + b)_F^{\frac{1}{2}}, \end{aligned}$$

which remained to complete the proof. ■

Finally, we examine the connection between different extensions of the operator sum. Suppose that A and B are positive, selfadjoint operators, and let $A + B$ denote the operator sum on $D = \text{dom } A \cap \text{dom } B$. Suppose that D is dense in \mathfrak{H} , so that the FRIEDRICHS extension $(A + B)_F$ of $A + B$ exists. KATO [4] shows an example when $A \dot{+} B \neq (A + B)_F$. Analogously, one can examine the connection between $A \dot{+} B$ and $(A + B)_K$. We will prove that in general $A \dot{+} B \neq (A + B)_K$. Note if we assume only that $\text{dom } A^{\frac{1}{2}} \cap \text{dom } B^{\frac{1}{2}}$ is dense in \mathfrak{H} – assuring the existence of $A \dot{+} B$ – the KREIN-VON NEUMANN extension will still exist. Indeed, it is easy to see that

$$\begin{aligned} D_*(A + B) &= \{y \in \mathfrak{H} : \exists m_y |((a + b)x, y)|^2 \leq m_y((a + b)x, x), \forall x \in D\} \supseteq \\ D_*(A) \cap D_*(B) &= \text{dom } A^{\frac{1}{2}} \cap \text{dom } B^{\frac{1}{2}}, \end{aligned}$$

so $D_*(A + B)$ is dense in \mathfrak{H} . However, it may happen that $\text{dom } A^{\frac{1}{2}} \cap \text{dom } B^{\frac{1}{2}}$ is dense in \mathfrak{H} while $\text{dom } A \cap \text{dom } B = \{\mathbf{0}\}$. In this case $A \dot{+} B \neq (A + B)_K = \mathbf{0}$, providing a trivial counter-example. For this reason, in the sequel we keep the assumption that D is dense in \mathfrak{H} .

Example 12. Consider the following example. Let a be a densely defined, closed, symmetric operator with positive lower bound. Suppose moreover that a is not selfadjoint. Then the deficiency index $\dim(\ker a^*)$ of a is greater than zero. Also, there are infinitely many selfadjoint extensions of a , which are restrictions of a^* . Among these the FRIEDRICHS extension a_F is the largest, and the KREIN-VON NEUMANN a_K is the smallest one with respect to the usual ordering of positive, selfadjoint operators. Consider a_K and a_F , both are positive and selfadjoint, and $D = \text{dom } a_K \cap \text{dom } a_F \supseteq \text{dom } a$, so D is dense in \mathfrak{H} . Furthermore, we have that $a_K \dot{+} a_F = 2a_F$, because

$$\text{dom } a_K^{\frac{1}{2}} \cap \text{dom } a_F^{\frac{1}{2}} = \text{dom } a_F^{\frac{1}{2}}, \text{ and } \|a_K^{\frac{1}{2}}x\|^2 = \|a_F^{\frac{1}{2}}x\|^2$$

for all $x \in \text{dom } a_F^{\frac{1}{2}}$. On the other hand, $(a_K + a_F)_K = 2a_K$, because $a_K + a_F$ is a symmetric extension of $2a$, hence $2a_K = (2a)_K \leq (a_K + a_F)_K$. Conversely, $(a_K + a_F)_K \leq 2a_K$, because $a_K + a_F$ is a restriction of $2a_K$. Thus we have that $a_K \dot{+} a_F \neq (a_K + a_F)_K$, as desired.

Example 13. A similar approach can provide an example when $A \dot{+} B \neq (A + B)_F$. The example above fails as $a_K \dot{+} a_F = 2a_F$ and $(a_K + a_F)_F = 2a_F$ as well. However, take any intermediate extension a_M of a instead of a_F . Then we have $a_K \dot{+} a_M \leq 2a_M$ because

$$\text{dom } (a_K \dot{+} a_M)^{\frac{1}{2}} = \text{dom } a_K^{\frac{1}{2}} \cap \text{dom } a_M^{\frac{1}{2}} = \text{dom } a_M^{\frac{1}{2}}$$

and

$$\|(a_K \dot{+} a_M)^{\frac{1}{2}}x\|^2 = \|a_K^{\frac{1}{2}}x\|^2 + \|a_M^{\frac{1}{2}}x\|^2 \leq \|(2a_M)^{\frac{1}{2}}x\|^2$$

for all $x \in \text{dom } a_M^{\frac{1}{2}}$. Furthermore, $(a_K + a_M)_F \geq 2a_M$ because both $a_K + a_M$ and $2a_M$ are extensions of $2a_M|_{\text{dom } a_K \cap \text{dom } a_M} = a_K + a_M$, here we have used that

$$a_K|_{\text{dom } a_K \cap \text{dom } a_M} = a^*|_{\text{dom } a_K \cap \text{dom } a_M} = a_M|_{\text{dom } a_K \cap \text{dom } a_M},$$

so the inequality follows from the extremality of the FRIEDRICHS extension. Thus we have

$$a_K \dot{+} a_M \leq 2a_M \leq (a_K + a_M)_F. \quad (11)$$

How can we assure that equality does not hold at both inequalities in (11)? It is easy to see from the above that a sufficient condition for a_M is that the form q_{a_M} of a_M is not a restriction of the form q_{a_K} of a_K . When $\dim(\ker a^*) > 0$, such an a_M is always available (see [1]). Just take any strictly positive, closed form q_0 on $\ker a^*$ (e.g. the original inner product) and define a new form q on $\ker a^* + \text{dom } a_F^{\frac{1}{2}}$ as follows

$$q(x + y) = q_0(x) + \|a_F^{\frac{1}{2}}y\|^2, \quad x \in \ker a^*, y \in \text{dom } a_F^{\frac{1}{2}}.$$

We have used that $\ker a^* \cap \text{dom } a_F^{\frac{1}{2}} = \{\mathbf{0}\}$. Using the representation theorem, we get the required a_M . (Note that a_K belongs to the choice $q_0 \equiv 0$.) Thus we see that a desired counter-example can be given whenever $\dim \ker a^* > 0$.
